

K-AllShelter® Safety Strut

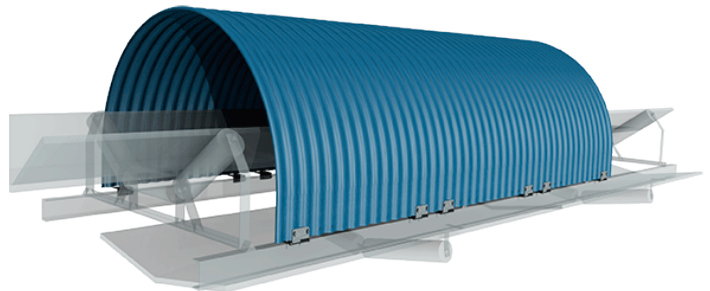

K-AllShelter® Safety Strut is a handy tool that allows you to gain access inside your **K-AllShelter® Conveyor Belt Covers**.

For safe operation it is recommended to use six K-AllShelter® Safety Struts.

This fully adjustable system effectively holds up the cover belt cover safely and securely so that any maintenance inside the covers can be easily performed.

K-AllShelter® Safety Strut will require the use of a ring spanner or shifting spanner to release the fixing bolts on your C1 hinges.

The system features a knuckle (fixing bolt and a wing nut) that provides the flexibility to adjust the profile, higher or lower depending on your requirements.

Once the K-AllShelter® Safety Strut is locked off and belt cover is open maintenance work can commence inside the covers.

Key Features/Benefits:

- Allows access inside belt covers to conduct maintenance work.
- Backward facing fork allows easy positioning underneath C1 hinges.
- Cam lock allows you to make micro adjustments when full access to do a full rotation is not available.
